

Package: safetyGraphics (via r-universe)

October 21, 2024

Title Interactive Graphics for Monitoring Clinical Trial Safety

Version 2.1.1

Maintainer Jeremy Wildfire <jwildfire@gmail.com>

Description A framework for evaluation of clinical trial safety. Users can interactively explore their data using the included 'Shiny' application.

app_startup *Startup code for shiny app*

Description

Prepare inputs for safetyGraphics app - run before app is initialized.

Usage

```
app_startup(
  domainData = NULL,
  meta = NULL,
  charts = NULL,
  mapping = NULL,
  autoMapping = NULL,
  filterDomain = NULL,
  chartSettingsPaths = NULL,
  appName = NULL,
  hexPath = NULL,
  homeTabPath = NULL
)
```

Arguments

- domainData named list of data.frames to be loaded in to the app. Sample AdAM data from the safetyData package used by default
- meta data frame containing the metadata for use in the app. If no metadata is provided (default value is NULL), metadata is generated by makeMeta().
- charts list of charts in the format produced by safetyGraphics::makeChartConfig()
- mapping list specifying the initial mapping values for each data mapping for each domain (e.g. list(aes= list(id_col='USUBJID', seq_col='AESEQ'))).
- autoMapping boolean indicating whether the app should attempt to automatically detect data standards and generate mappings for the data provided. Values specified in the mapping parameter overwrite automatically generated mappings when both are found. Defaults to true.
- filterDomain domain used for the data/filter tab. Demographics ("dm") is used by default. Using a domain that is not one record per participant is not recommended.
- chartSettingsPaths path(s) where customization functions are saved relative to your working directory. All charts can have initialization (e.g. myChart_Init.R) and static charts can have charting functions (e.g. myGraphic_Chart.R). All R files in this folder are sourced and files with the correct naming convention are linked to the chart. See the Custom Charts vignette for more details.

| | |
|-------------|---|
| appName | character string defining the name of the app (default = "safetyGraphics") |
| hexPath | path to image file with a hex or other logo. safetyGraphics hex used by default. |
| homeTabPath | path to html content to be used on the home page. default is a summary of the safetyGraphics framework. |

Value

List of elements for used to initialize the shiny app with the following parameters

- "meta" List of configuration metadata
- "charts" List of charts
- "domainData" List of domain level data sets
- "mapping" Initial Data Mapping
- "standards" List of domain level data standards

| | |
|-----------|--------------------------------|
| chartsNav | <i>Server for a navbar tab</i> |
|-----------|--------------------------------|

Description

Server for a navbar tab

Usage

```
chartsNav(input, output, session, chart, data, mapping)
```

Arguments

| | |
|---------|---|
| input | Input objects from module namespace |
| output | Output objects from module namespace |
| session | An environment that can be used to access information and functionality relating to the session |
| chart | list containing a safetyGraphics chart object like those returned by makeChart-Config . |
| data | named list of current data sets (Reactive). |
| mapping | tibble capturing the current data mappings (Reactive). |

| | |
|-------------|---|
| chartsNavUI | <i>Adds a navbar tab that initializes the Chart Module UI</i> |
|-------------|---|

Description

Adds a navbar tab that initializes the Chart Module UI

Usage

```
chartsNavUI(id, chart)
```

Arguments

| | |
|-------|----------------|
| id | module id |
| chart | chart metadata |

| | |
|-----------|--|
| chartsTab | <i>Server for chart module, designed to be re-used for each chart generated.</i> |
|-----------|--|

Description

Server for chart module, designed to be re-used for each chart generated.

Usage

```
chartsTab(input, output, session, chart, data, mapping, status)
```

Arguments

| | |
|---------|---|
| input | Input objects from module namespace |
| output | Output objects from module namespace |
| session | An environment that can be used to access information and functionality relating to the session |
| chart | list containing a safetyGraphics chart object like those returned by makeChart-Config . |
| data | named list of current data sets (Reactive). |
| mapping | tibble capturing the current data mappings (Reactive). |
| status | chart status (Reactive) |

| | |
|-------------|--|
| chartsTabUI | <i>UI for chart module, designed to be re-used for each chart generated.</i> |
|-------------|--|

Description

UI for chart module, designed to be re-used for each chart generated.

Usage

```
chartsTabUI(id, chart)
```

Arguments

| | |
|-------|---|
| id | module id |
| chart | list containing chart specifications like those returned by makeChartConfig . |

| | |
|----------------|---|
| detectStandard | <i>Detect the data standard used for a data set</i> |
|----------------|---|

Description

This function attempts to detect the clinical data standard used in a given R data frame.

Usage

```
detectStandard(data, domain = NULL, meta = NULL)
```

Arguments

| | |
|--------|--|
| data | A data frame in which to detect the data standard - required. |
| domain | the domain to evaluate - should match a value of meta\$domain. Uses the first value in meta\$domain if no value is provided. |
| meta | the metadata containing the data standards. |

Details

This function compares the columns in the provided "data" with the required columns for a given data standard/domain combination. The function is designed to work with the SDTM and ADaM CDISC(<https://www.cdisc.org/>) standards for clinical trial data by default. Additional standards can be added by modifying the "meta" data set included as part of this package.

Value

A data frame describing the detected standard for each "text_key" in the provided metadata. Columns are "domain", "text_key", "column" and "standard".

Examples

```
detectStandard(data=safetyData::adam_adae, meta=safetyCharts::meta_aes)
detectStandard(data=safetyData::adam_adlbc, meta=safetyCharts::meta_labs, domain="labs" )
```

| | |
|------------------|--|
| evaluateStandard | <i>Evaluate a data set against a data standard</i> |
|------------------|--|

Description

Determines whether the required data elements in a data standard are found in a given data frame

Usage

```
evaluateStandard(data, meta, domain, standard)
```

Arguments

| | |
|----------|---|
| data | A data frame in which to detect the data standard |
| meta | the metadata containing the data standards. |
| domain | the domain to evaluate - should match a value of meta\$domain |
| standard | standard to evaluate |

Value

a list describing to what degree the data set matches the data standard. The "match" property describes compliance with the standard as "full", "partial" or "none". The "checks" property is a list of the data elements expected for the standard and whether they are "valid" in the given data set. "total_checks", "valid_checks" and "invalid_checks" provide counts of the specified checks. "match_percent" is calculated as valid_checks/total_checks. "mapping" is a data frame describing the detected standard for each "text_key" in the provided metadata. Columns are "text_key", "current" containing the name of the matched column or field value in the data and "match" a boolean indicating whether the data matches the standard.

Examples

```
# Match is TRUE
evaluateStandard(
  data=safetyData::adam_adlbc,
  meta=safetyCharts::meta_labs,
  domain="labs",
  standard="adam"
)

# Match is FALSE
evaluateStandard(
  data=safetyData::adam_adlbc,
```

```
meta=safetyCharts::meta_labs,  
domain="labs",  
standard="sdtm"  
)
```

filterTab*Server for the filter module in datamods::filter_data_ui*

Description

Server for the filter module in datamods::filter_data_ui

Usage

```
filterTab(  
  input,  
  output,  
  session,  
  domainData,  
  filterDomain,  
  current_mapping,  
  tabID = "Filtering",  
  filterVars = NULL  
)
```

Arguments

| | |
|-----------------|--|
| input | Shiny input object |
| output | Shiny output object |
| session | Shiny session object |
| domainData | list of data files for each domain |
| filterDomain | domain to use for filtering (typically "dm") |
| current_mapping | current data mapping |
| tabID | ID for the tab containing the filter UI (used for testing) |
| filterVars | Variables to use for filtering (used for testing) |

Value

filtered data set

| | |
|-----------------|--|
| filterTabChecks | <i>Checks for whether the current data and settings support a filter tab</i> |
|-----------------|--|

Description

Checks for whether the current data and settings support a filter tab

Usage

```
filterTabChecks(domainData, filterDomain, current_mapping)
```

Arguments

| | |
|-----------------|--|
| domainData | list of data files for each domain |
| filterDomain | domain to use for filtering (typically "dm") |
| current_mapping | current data mapping (REACTIVE) |

Value

reactive that returns a boolean indicating whether the checks passed and filtering can be initialized

| | |
|-------------|---|
| filterTabUI | <i>UI for the filter module in datamods::filter_data_ui</i> |
|-------------|---|

Description

UI for the filter module in datamods::filter_data_ui

Usage

```
filterTabUI(id)
```

Arguments

| | |
|----|-----------|
| id | module id |
|----|-----------|

generateMappingList *Convert mapping data.frame to a list*

Description

Convert mapping data.frame to a list

Usage

```
generateMappingList(settingsDF, domain = NULL, pull = FALSE)
```

Arguments

| | |
|------------|--|
| settingsDF | data frame containing current mapping |
| domain | mapping domain to return (returns all domains as a named list by default) |
| pull | call pull() the value for each parameter - needed for testing only. default: FALSE |

homeTab *Server for the filter module in datamods::filter_data_ui*

Description

Server for the filter module in datamods::filter_data_ui

Usage

```
homeTab(input, output, session, config)
```

Arguments

| | |
|---------|-------------|
| input | mod input |
| output | mod output |
| session | mod session |

| | |
|-----------|-------------------------------|
| homeTabUI | <i>UI for the home module</i> |
|-----------|-------------------------------|

Description

UI for the home module

Usage

```
homeTabUI(id)
```

Arguments

| | |
|----|-----------|
| id | module id |
|----|-----------|

| | |
|------------|---|
| loadCharts | <i>Server for the chart loading module used in safetyGraphicsInit()</i> |
|------------|---|

Description

Server for the chart loading module used in safetyGraphicsInit()

Usage

```
loadCharts(input, output, session, charts = makeChartConfig())
```

Arguments

| | |
|---------|---|
| input | Shiny input object |
| output | Shiny output object |
| session | Shiny session object |
| charts | list containing chart specifications like those returned by makeChartConfig . |

| | |
|--------------|---|
| loadChartsUI | <i>UI for the chart loading module used in safetyGraphicsInit()</i> |
|--------------|---|

Description

UI for the chart loading module used in safetyGraphicsInit()

Usage

```
loadChartsUI(id, charts = makeChartConfig())
```

Arguments

| | |
|--------|---|
| id | module id |
| charts | list containing chart specifications like those returned by makeChartConfig . |

| | |
|----------|--|
| loadData | <i>Server for the data loading module used in safetyGraphicsInit()</i> |
|----------|--|

Description

Server for the data loading module used in safetyGraphicsInit()

Usage

```
loadData(input, output, session, domain)
```

Arguments

| | |
|---------|--------------------------|
| input | Shiny input object |
| output | Shiny output object |
| session | Shiny session object |
| domain | data domain to be loaded |

| | |
|------------|--|
| loadDataUI | <i>UI for the data loading module used in safetyGraphicsInit()</i> |
|------------|--|

Description

UI for the data loading module used in safetyGraphicsInit()

Usage

```
loadDataUI(id, domain = NULL)
```

Arguments

| | |
|--------|--|
| id | module id |
| domain | character vector with domains to be loaded |

| | |
|-----------------|--------------------------|
| makeChartConfig | <i>Make Chart Config</i> |
|-----------------|--------------------------|

Description

Converts YAML chart configuration files to an R list and binds workflow functions. See the vignette about creating custom charts for more details.

Usage

```
makeChartConfig(
  dirs,
  packages = "safetyCharts",
  packageLocation = "config",
  sourceFiles = FALSE
)
```

Arguments

| | |
|-----------------|--|
| dirs | path to one or more directories containing yaml config files (relative to working directory) |
| packages | installed packages names containing yaml config files in the /inst/packageLocation folder |
| packageLocation | inst folder where yaml config files (and possibly R functions referenced in yaml workflow) are located in packages |
| sourceFiles | boolean indicating whether to source all R files found in dirs. |

Value

returns a named list of charts derived from YAML files. Each element of the list contains information about a single chart, and has the following parameters:

- "env" Environment for the chart. Must be set to "safetyGraphics" or the chart is dropped.
- "name" Name of the chart. Also the name of the element in the list - e.g. charts\$aExplorer\$name is "aExplorer"
- "label" Short description of the chart
- "type" Type of chart; options are: 'htmlwidget', 'module', 'plot', 'table', 'html' or 'plotly'.
- "domain" Data domain. Should correspond to one or more domains in meta
- "package" Primary package (if any). Other packages can be loaded directly in workflow functions.
- "order" Integer order in which to display the chart. If order is a negative number, the chart is dropped.
- "export" Logical flag indicating whether the chart can be exported to an html report. True by default, except for when type is module.
- "path" Path to YAML file
- "links" Named list of link names/urls to be shown in the chart header.
- "workflow" List of functions names used to render chart. See vignette for details.
- "functions" List of functions for use in chart rendering. These functions must be located in the global environment or package field of the YAML config. Function names must include either the name or workflow fields of the YAML config.

makeChartExport

Make Chart Export

Description

Creates R code that allows chart to be exported

Usage

```
makeChartExport(chart, mapping)
```

Arguments

| | |
|---------|---|
| chart | chart object like the one generated by makeChartConfig(). |
| mapping | mapping object like the one generated by makeMapping(). |

Value

returns a character vector that can be saved as R code.

| | |
|-----------------|------------------------------|
| makeChartParams | <i>Make Chart Parameters</i> |
|-----------------|------------------------------|

Description

Updates raw data and mapping for use with a specific chart

Usage

```
makeChartParams(data, chart, mapping)
```

Arguments

| | |
|---------|--------------------------------------|
| data | list of domain-level data |
| chart | list containing chart specifications |
| mapping | data frame with current mapping |

| | |
|------------------|---------------------------|
| makeChartSummary | <i>html chart summary</i> |
|------------------|---------------------------|

Description

makes a nicely formatted html summary for a chart object

Usage

```
makeChartSummary(  
  chart,  
  status = NULL,  
  showLinks = TRUE,  
  class = "chart-header"  
)
```

Arguments

| | |
|-----------|---|
| chart | list containing chart specifications |
| status | (optional) chart status from getChartStatus. Default is NULL. |
| showLinks | boolean indicating whether to include links |
| class | character to include as class |

| | |
|-------------|---|
| makeMapping | <i>Create data mapping based on data standards and user input</i> |
|-------------|---|

Description

Create data mapping based on data standards and user input

Usage

```
makeMapping(domainData, meta, autoMapping, customMapping)
```

Arguments

| | |
|---------------|---|
| domainData | named list of data.frames to be loaded in to the app. Sample AdAM data from the safetyData package used by default |
| meta | data frame containing the metadata for use in the app. |
| autoMapping | boolean indicating whether the app should use <code>safetyGraphics::detectStandard()</code> to detect data standards and automatically generate mappings for the data provided. Values specified in the <code>customMapping</code> parameter overwrite auto-generated mappings when both are found. Defaults to true. |
| customMapping | optional list specifying initial mapping values within each data mapping (e.g. <code>list(aes= list(id_col='USUBJID', seq_col='AESEQ'))</code>). |

Value

List containing data standard information and mapping

- "mapping" Initial Data Mapping
- "standards" List of domain level data standards (or NULL if autoMapping is false)

| | |
|----------|---|
| makeMeta | <i>Create a metadata object table for a set of charts</i> |
|----------|---|

Description

Generates metadata object for a list of charts. `makeMeta()` looks for metadata in 3 locations for each chart object:

- Domain-level metadata saved as `meta_chart$name` in the `chart$package` namespace
- Chart-specific metadata saved as `meta_chart$domain` in the `chart$package` namespace
- Chart-specific metadata saved directly to the chart object as `chart$meta` After checking all charts, all metadata files are stacked in to a single dataframe and returned. If duplicate metadata rows (`domain + text_key`) are found, an error is thrown.

Usage

```
makeMeta(charts)
```

Arguments

charts list of safetyGraphics chart objects for which to create metadata

Value

tibble of metadata with the following columns:

domain Data domain

text_key Text key indicating the setting name. '--' delimiter indicates a field level data mapping

col_key Key for the column mapping

field_key Key for the field mapping (if any)

type type of mapping - "field" or "column"

label Label

description Description

multiple Mapping supports multiple columns/fields

standard_adam Default values for the ADaM data standard

standard_sdtm Default values for the SDTM data standard

| | |
|---------------|---|
| mappingColumn | <i>Server that facilitates the mapping of a column data (and any associated fields)</i> |
|---------------|---|

Description

Server that facilitates the mapping of a column data (and any associated fields)

Usage

```
mappingColumn(input, output, session, meta, data)
```

Arguments

input Shiny input object

output Shiny output object

session Shiny session object

meta metadata data frame for the object

data current data file for the domain

Value

A reactive data.frame providing the current value for text_key associated with the selected column

| | |
|-----------------|---|
| mappingColumnUI | <i>UI that facilitates the mapping of a column data (and any associated fields)</i> |
|-----------------|---|

Description

UI that facilitates the mapping of a column data (and any associated fields)

Usage

```
mappingColumnUI(id, meta, data, mapping = NULL)
```

Arguments

| | |
|---------|--|
| id | module id |
| meta | metadata for the column (and related fields) |
| data | current data file for the domain |
| mapping | current data mapping for the column (and related fields) |

| | |
|---------------|--|
| mappingDomain | <i>Server that facilitates the mapping of a full data domain</i> |
|---------------|--|

Description

Server that facilitates the mapping of a full data domain

Usage

```
mappingDomain(input, output, session, meta, data)
```

Arguments

| | |
|---------|------------------------------|
| input | Shiny input object |
| output | Shiny output object |
| session | Shiny session object |
| meta | metadata for the domain |
| data | clinical data for the domain |

Value

A reactive data frame containing the mapping for the domain

| | |
|-----------------|--|
| mappingDomainUI | <i>UI that facilitates the mapping of a full data domain</i> |
|-----------------|--|

Description

UI that facilitates the mapping of a full data domain

Usage

```
mappingDomainUI(id, meta, data, mapping = NULL)
```

Arguments

| | |
|---------|--------------------------|
| id | module id |
| meta | metadata for the domain |
| data | data file for the domain |
| mapping | current data mapping |

| | |
|---------------|---|
| mappingSelect | <i>Server that facilitates the mapping of a single data element (column or field) with a simple select UI</i> |
|---------------|---|

Description

Server that facilitates the mapping of a single data element (column or field) with a simple select UI

Usage

```
mappingSelect(input, output, session)
```

Arguments

| | |
|---------|----------------------|
| input | Shiny input object |
| output | Shiny output object |
| session | Shiny session object |

Value

A reactive containing the selected column

| | |
|-----------------|---|
| mappingSelectUI | <i>UI that facilitates the mapping of a single data element (column or field) with a simple select UI</i> |
|-----------------|---|

Description

UI that facilitates the mapping of a single data element (column or field) with a simple select UI

Usage

```
mappingSelectUI(id, label, choices = NULL, default = NULL)
```

Arguments

| | |
|---------|-----------------------------------|
| id | unique id for the UI |
| label | label associated with the control |
| choices | a list of options for the control |
| default | default value for the control |

Value

returns the selected value wrapped in a reactive().

| | |
|------------|--|
| mappingTab | <i>Server for mapping tab covering of all data domains</i> |
|------------|--|

Description

Server for mapping tab covering of all data domains

Usage

```
mappingTab(input, output, session, meta, domainData)
```

Arguments

| | |
|------------|-------------------------------|
| input | Shiny input object |
| output | Shiny output object |
| session | Shiny session object |
| meta | metadata for all domains |
| domainData | clinical data for all domains |

Value

list of mappings for all domains

`mappingTabUI`*UI for mapping tab covering of all data domains*

Description

UI for mapping tab covering of all data domains

Usage

```
mappingTabUI(id, meta, domainData, mappings = NULL, standards = NULL)
```

Arguments

| | |
|-------------------------|--|
| <code>id</code> | module id |
| <code>meta</code> | metadata for all domains |
| <code>domainData</code> | list of data files for each domain |
| <code>mappings</code> | optional data frame containing stacked mappings for all domains |
| <code>standards</code> | optional list of data standards like the ones generated by <code>detectStandard()</code> |

`prepareChart`*Prepare a chart object for safetyGraphics*

Description

Sets default values and binds needed functions to a chart object based on chart type.

Usage

```
prepareChart(chart)
```

Arguments

| | |
|--------------------|---|
| <code>chart</code> | chart object like the one generated by <code>makeChartConfig()</code> . |
|--------------------|---|

Value

returns the chart object with a new functions object added.

| | |
|------------|--|
| profileTab | <i>Server for the patient profile in safetyProfile::profile_server</i> |
|------------|--|

Description

Server for the patient profile in safetyProfile::profile_server

Usage

```
profileTab(input, output, session, params)
```

Arguments

| | |
|------------|--|
| input | Shiny input object |
| output | Shiny output object |
| session | Shiny session object |
| params | reactive containing mapping and data |
| current_id | reactive containing currently selected participant |

Value

current_id

| | |
|--------------|---|
| profileTabUI | <i>UI for the profile module in safetyProfile::profile_ui</i> |
|--------------|---|

Description

UI for the profile module in safetyProfile::profile_ui

Usage

```
profileTabUI(id)
```

Arguments

| | |
|----|-----------|
| id | module id |
|----|-----------|

safetyGraphicsApp *Run the core safetyGraphics App*

Description

Run the core safetyGraphics App

Usage

```
safetyGraphicsApp(
  domainData = list(labs = safetyData::adam_adlbc, aes = safetyData::adam_adae, dm =
    safetyData::adam_adsl),
  meta = NULL,
  charts = NULL,
  mapping = NULL,
  autoMapping = TRUE,
  filterDomain = "dm",
  chartSettingsPaths = NULL,
  appName = "safetyGraphics",
  hexPath = system.file("resources/safetyGraphicsHex.png", package = "safetyGraphics"),
  homeTabPath = system.file("resources/safetyGraphicsHomeTab.html", package =
    "safetyGraphics"),
  launchBrowser = FALSE,
  runNow = TRUE
)
```

Arguments

| | |
|--------------------|---|
| domainData | named list of data.frames to be loaded in to the app. Sample AdAM data from the safetyData package used by default |
| meta | data frame containing the metadata for use in the app. If no metadata is provided, metadata is generated by makeMeta(). |
| charts | list of charts in the format produced by safetyGraphics::makeChartConfig() |
| mapping | list specifying the initial mapping values for each data mapping for each domain (e.g. list(aes= list(id_col='USUBJID', seq_col='AESEQ'))). |
| autoMapping | boolean indicating whether the app should attempt to automatically detect data standards and generate mappings for the data provided. Values specified in the mapping parameter overwrite automatically generated mappings when both are found. Defaults to true. |
| filterDomain | domain used for the data/filter tab. Demographics ("dm") is used by default. Using a domain that is not one record per participant is not recommended. |
| chartSettingsPaths | path(s) where customization functions are saved relative to your working directory. All charts can have initialization (e.g. myChart_Init.R) and static charts can have charting functions (e.g. myGraphic_Chart.R). All R files in this folder |

are sourced and files with the correct naming convention are linked to the chart. See the Custom Charts vignette for more details.

| | |
|---------------|--|
| appName | character string defining the name of the app (default = "safetyGraphics") |
| hexPath | path to image file with a hex or other logo. safetyGraphics hex used by default. |
| homeTabPath | path to html content to be used on the home page. default is a summary of the safetyGraphics framework. |
| launchBrowser | boolean indicating whether to launch the app in a browser. default is false |
| runNow | Should the shiny app object created be run directly? Helpful when writing functions to dispatch to shinyapps, rconnect, or shinyproxy. |

| | |
|--------------------|--|
| safetyGraphicsInit | <i>App to select charts, load data and then initialize the core safetyGraphics app</i> |
|--------------------|--|

Description

App to select charts, load data and then initialize the core safetyGraphics app

Usage

```
safetyGraphicsInit(
  charts = makeChartConfig(),
  delayTime = 1000,
  maxFileSize = NULL
)
```

Arguments

| | |
|-------------|---|
| charts | chart object |
| delayTime | time (in ms) between drawing app UI and starting server. Default set to 1000 (1 second), but could need to be higher on slow machine. |
| maxFileSize | maximum file size in MB allowed for file upload |

| | |
|----------------------|---|
| safetyGraphicsServer | <i>Server for core safetyGraphics app including Home, Mapping, Filter, Charts and Settings modules.</i> |
|----------------------|---|

Description

This function returns a server function suitable for use in shiny::runApp()

Usage

```
safetyGraphicsServer(
  input,
  output,
  session,
  meta,
  mapping,
  domainData,
  charts,
  filterDomain,
  config
)
```

Arguments

| | |
|--------------|--|
| input | Shiny input object |
| output | Shiny output object |
| session | Shiny session object |
| meta | data frame containing the metadata for use in the app. |
| mapping | current mapping |
| domainData | named list of data.frames to be loaded in to the app. |
| charts | list of charts to include in the app |
| filterDomain | domain used for the data/filter tab. Demographics ("dm") is used by default. Using a domain that is not one record per participant is not recommended. |

| | |
|------------------|---|
| safetyGraphicsUI | <i>UI for the core safetyGraphics app including Home, Mapping, Filter, Charts and Settings modules.</i> |
|------------------|---|

Description

UI for the core safetyGraphics app including Home, Mapping, Filter, Charts and Settings modules.

Usage

```
safetyGraphicsUI(id, meta, mapping, domainData, charts, standards, config)
```

Arguments

| | |
|------------|--|
| id | module ID |
| meta | data frame containing the metadata for use in the app. |
| mapping | data.frame specifying the initial values for each data mapping. If no mapping is provided, the app will attempt to generate one via detectStandard() |
| domainData | named list of data.frames to be loaded in to the app. |

| | |
|-----------|--|
| charts | list of charts in the format produced by <code>safetyGraphics::makeChartConfig()</code> |
| standards | a list of information regarding data standards. Each list item should use the format returned by <code>safetyGraphics::detectStandard</code> . |

| | |
|----------------|---|
| settingsCharts | <i>Server for settings tab showing details for the charts loaded in the app</i> |
|----------------|---|

Description

Server for settings tab showing details for the charts loaded in the app

Usage

```
settingsCharts(input, output, session, charts)
```

Arguments

| | |
|---------|--|
| input | Shiny input object |
| output | Shiny output object |
| session | Shiny session object |
| charts | list data frame summarizing the charts |

| | |
|------------------|---|
| settingsChartsUI | <i>UI for settings tab showing details for the charts loaded in the app</i> |
|------------------|---|

Description

UI for settings tab showing details for the charts loaded in the app

Usage

```
settingsChartsUI(id)
```

Arguments

| | |
|----|-----------|
| id | module id |
|----|-----------|

| | |
|--------------|--|
| settingsCode | <i>Server for settings tab providing code to re-start the app with current data/settings</i> |
|--------------|--|

Description

Server for settings tab providing code to re-start the app with current data/settings

Usage

```
settingsCode(input, output, session, mapping, charts, domainData)
```

Arguments

| | |
|------------|----------------------|
| input | Shiny input object |
| output | Shiny output object |
| session | Shiny session object |
| mapping | mapping |
| charts | charts |
| domainData | data list |

| | |
|----------------|--|
| settingsCodeUI | <i>UI for settings tab providing code to re-start the app with current data/settings</i> |
|----------------|--|

Description

UI for settings tab providing code to re-start the app with current data/settings

Usage

```
settingsCodeUI(id)
```

Arguments

| | |
|----|-----------|
| id | module ID |
|----|-----------|

| | |
|--------------|---|
| settingsData | <i>Server for settings tab showing current data</i> |
|--------------|---|

Description

Server for settings tab showing current data

Usage

```
settingsData(input, output, session, domains)
```

Arguments

| | |
|---------|---|
| input | Shiny input object |
| output | Shiny output object |
| session | Shiny session object |
| domains | named list of the data.frames for each domain |

| | |
|----------------|---|
| settingsDataUI | <i>UI for settings tab showing current data</i> |
|----------------|---|

Description

UI for settings tab showing current data

Usage

```
settingsDataUI(id)
```

Arguments

| | |
|----|-----------|
| id | module id |
|----|-----------|

| | |
|-----------------|--|
| settingsMapping | <i>Server for settings tab showing current mapping</i> |
|-----------------|--|

Description

Server for settings tab showing current mapping

Usage

```
settingsMapping(input, output, session, metadata, mapping)
```

Arguments

| | |
|----------|--|
| input | Shiny input object |
| output | Shiny output object |
| session | Shiny session object |
| metadata | Data mapping metadata used for initial loading of app |
| mapping | reactive data frame representing the current metadata mapping. columns = "domain", "text_id" and "current" |

| | |
|-------------------|--|
| settingsMappingUI | <i>UI for settings tab showing current mapping</i> |
|-------------------|--|

Description

UI for settings tab showing current mapping

Usage

```
settingsMappingUI(id)
```

Arguments

| | |
|----|-----------|
| id | module id |
|----|-----------|

settingsTab

Server for the setting page

Description

Server for the setting page

Usage

```
settingsTab(input, output, session, domains, metadata, mapping, charts)
```

Arguments

| | |
|----------|----------------------|
| input | Shiny input object |
| output | Shiny output object |
| session | Shiny session object |
| domains | domains |
| metadata | metadata |
| mapping | mapping |
| charts | charts |

settingsTabUI

UI for the settings tab

Description

UI for the settings tab

Usage

```
settingsTabUI(id)
```

Arguments

| | |
|----|-----------|
| id | module ID |
|----|-----------|
